2 Kommunikations-Eigenschaften

Es können eine Reihe von Parameter und Istwerte von der Steuerzentrale der Wärmepumpe ausgelesen bzw. beschrieben werden. Die Steuerzentrale fungiert dabei als Server (Slave).

Die Zeit eines Kommunikationstimeout beträgt 1min. Erfolgt in dieser Zeit kein Abruf wird die Verbindung geschlossen und muss neu aufgebaut werden.

Die Lesefunktion erfolgt über die Modbus Funktionscode 0x03 (read multiple holding register)

Die Schreibfunktion erfolgt über die Modbus Funktionscode 0x10 (write multiple writing register)

ACHTUNG: Steuerzentrale kann nur als Server (Slave) agieren!

3 Modbus Protokoll TCP & RTU

Die Register Adresse ist wie folgt strukturiert.

X _ _ -> Erste Stelle: Index (wird von Modultyp vorgegeben)

_ X _ _ -> Zweite Stelle: Subindex (wird von Modulnummer vorgegeben)

__ X X -> Letzten 2 Stellen: Number (wird von Datenpunkt vorgegeben)

3.1 Index

Der Index wird über das Modul vorgegeben.

• General = 0

• Heatpump = 1

• Boiler = 2

• Buffer = 3

• Solar = 4

Heating circuit = 5

3.2 Subindex

Die Modulnummer ergibt sich aus der Reihenfolge wie gleichartige Modultypen im Konfigurationsmodul angelegt wurden. Hiervon ausgenommen ist Modultyp General => Subindex fix vergeben. Module, die weiter oben gereiht sind (niedrigerer Nr.) werden über den niedrigeren Subindex angesprochen.

Beispiel:

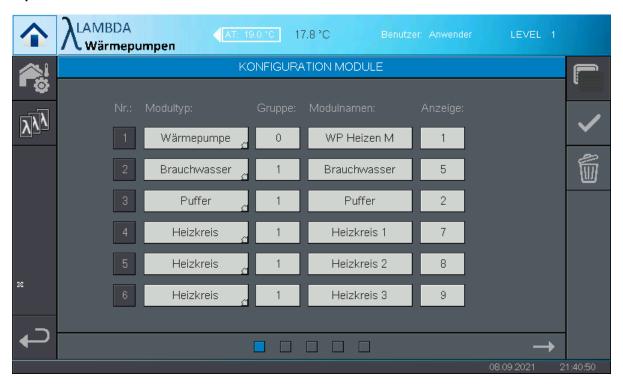

Abbildung 1: Konfiguration Module Seite 1

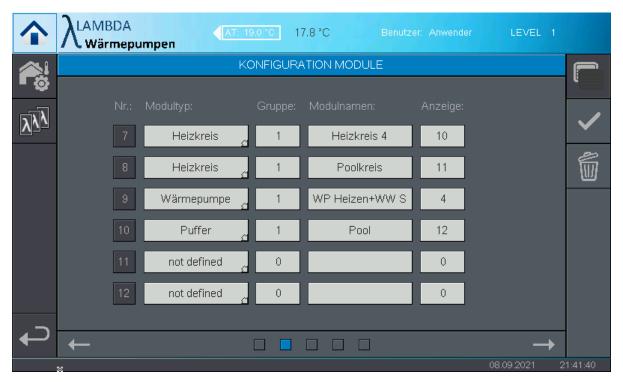

Abbildung 2: Konfiguration Module Seite 2

In diesem Fall besitzt:

Tabelle 1: Beispiel für Index-Vergabe

Nr	Modulname	Subindexname	Subindex	
Nr. 1	WP Heizen M	Heat pump 1	0	
Nr. 9	WP Heizen + WW S	Heat pump 2	1	
Nr. 2	Brauchwasser	Boiler 1	0	
Nr. 3	Puffer	Buffer 1	0	
Nr. 10	Pool	Buffer 2	1	
Nr. 4	Heizkreis 1	Circuit 1	0	
Nr. 5	Heizkreis 2	Circuit 2	1	
Nr. 6	Heizkreis 3	Circuit 3	2	
Nr. 7	Heizkreis 4	Circuit 4	3	
Nr. 8	Poolkreis	Circuit 5	4	

Z.B. Register zum Auslesen der Vorlauftemperatur (flowline temperature) der Wärmepumpe "Heizen+WW S":

1 04 = 1104

Index Subindex Number

3.3 Number

Die Number ist dem spezifischen Datenpunkt der ausgelesen oder beschrieben werden soll zugeordnet (siehe Modbusprotokoll). Wenn Datenpunkte zwischen 00-49 die beschrieben werden sollen, muss der Wert regelmäßig aktualisiert werden (Timeout nach 5min). Ansonsten wird der Wert als ungültig betrachtet und eine Defaultwert wird zugewiesen. Datenpunkte über 50 können einmalig beschrieben werden. Der Wert wird dauerhaft gespeichert.

4 Modbus Client als Datenquelle definieren

Folgende Datenpunkte, die separat in der Bedienoberfläche aktiviert werden müssen, definieren den Modbus Client als Datenquelle

Außentemperatur

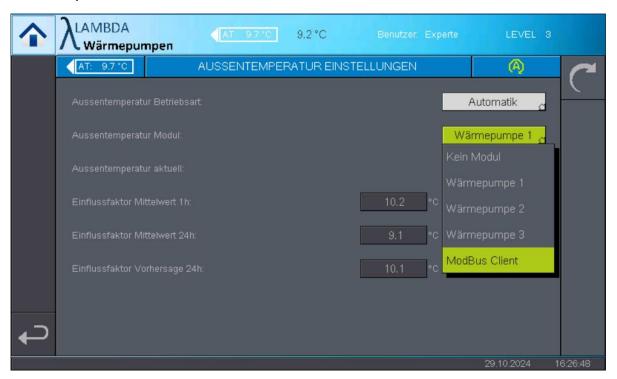

Abbildung 3: Modbusclient als Datenquelle für Außentemperatur definieren

Überschussenergie (PV Überschuss)

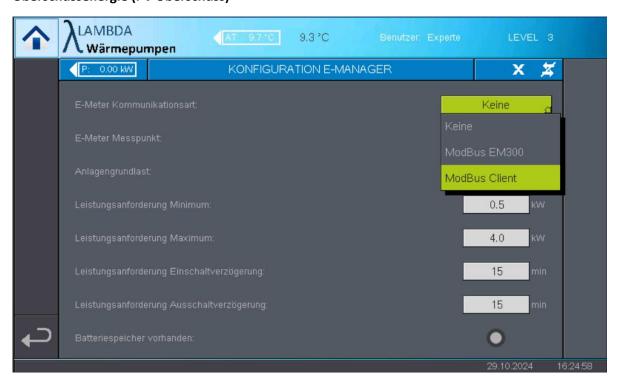

Abbildung 4: Modbus Client als Datenquelle für PV-Überschuss definieren

Raumfühler

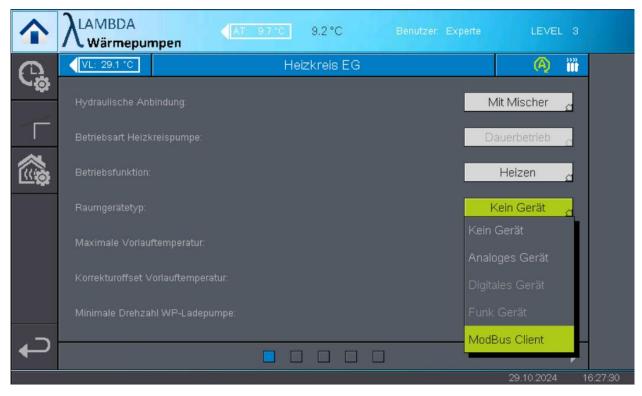

Abbildung 5: Modbus Client als Datenquelle für Heizkreis definieren

5 Modbus TCP/IP Einstellungen

Die Kommunikation erfolgt über den Netzwerkanschluss des Displays. Stellen Sie sicher, dass die Verbindung zum Netzwerk funktioniert, und richten Sie das Gerät im Netzwerk im Menüpunkt Netzwerkeinstellungen ein (Suche einer freien IP Adresse mittel DHCP oder manuelle Vergabe).

Abbildung 6: Netzwerkeinstellungen

5.1 Kommunikation Einstellungen

- Unit ID ist 1
- Kommunikation erfolgt über Port 502
- Es können bis zu 16 Kommunikationskanäle (16 Master) bedient werden.
- Die Server IP Adresse wird in der Steuerung auf der Seite "Netzwerkeinstellungen" angezeigt.
- ACHTUNG!!!:

Die Verbindung darf nicht bei jeder Modbusanforderung aufgebaut und wieder geschlossen werden. Ansonsten kann es zu schweren Störungen kommen.

5.2 Freigegebene Functioncodes

- Read: Functionscode 0x03 (read **multiple** holding register)
- Write: Functionscode 0x10 (write **multiple** writing register)

6 Modbus RTU Einstellungen

Die Kommunikation erfolgt über den RS485 Anschluss auf der Rückseite des Bedienteils. Es müssen zwei Abschlusswiderstände mit je 120 Ohm an den Endgeräten des Bussystems vorhanden sein.

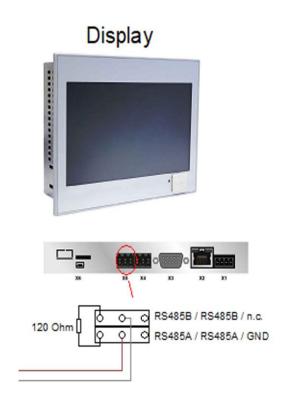

Abbildung 7: Darstellung Display und RS485 Anschluss

6.1 Kommunikationseinstellungen

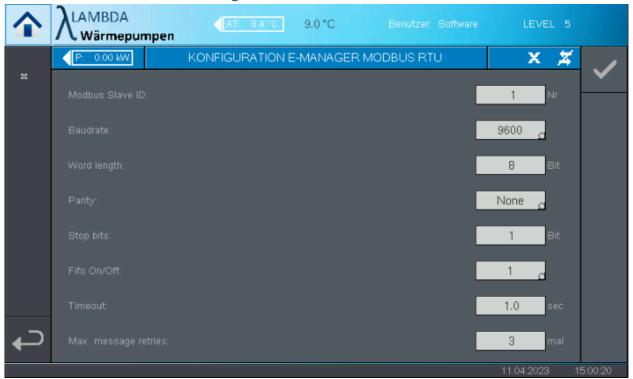

Abbildung 8: Konfiguration Modbus RTU

6.2 Freigegebene Functioncodes

- Read: Functionscode 0x03 (read **multiple** holding register)
- Write: Functionscode 0x10 (write multiple writing register)
